# Ceramic processing and applications

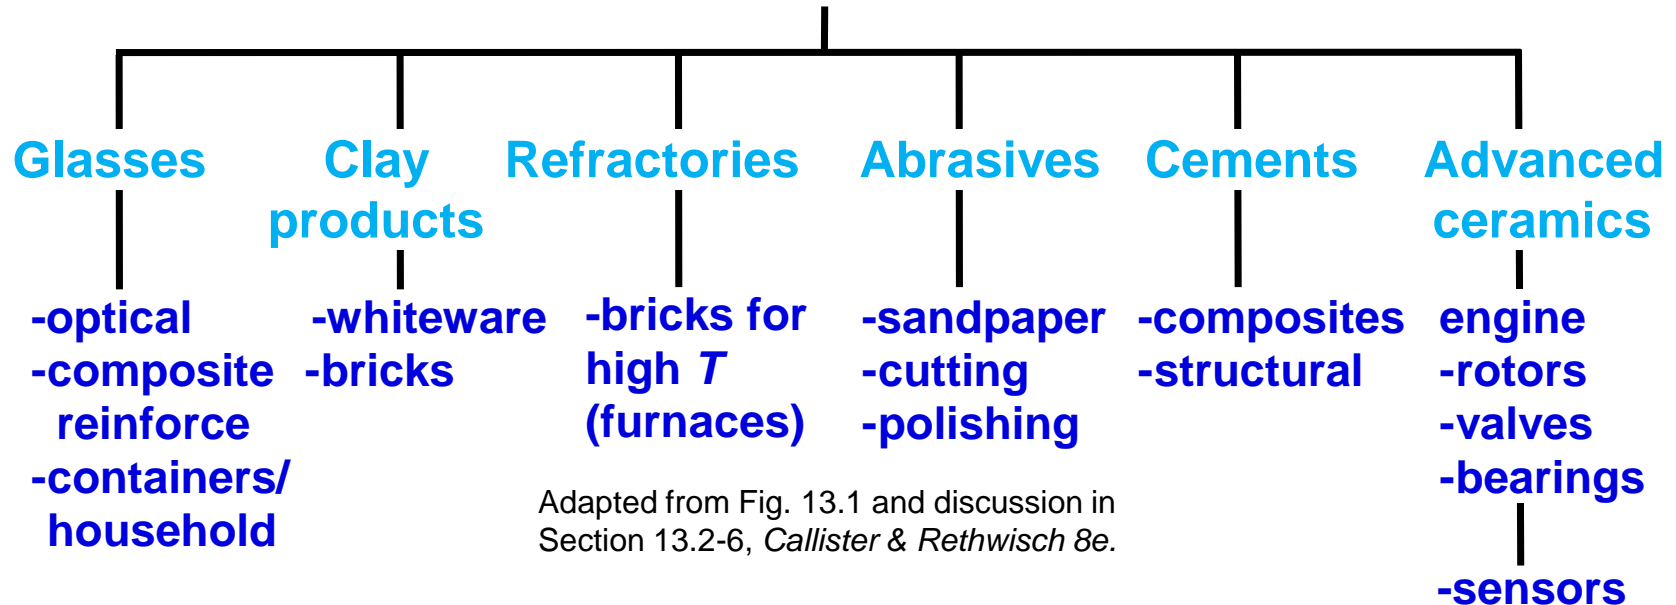

# Intended Learning Outcomes

**At the end of this section, students will be able to:-**

- Identify the **classes** of ceramics.
- Understand **how** and **why** ceramics are used.
- Describe **ceramic processing** and how it differs from that of metals.

# Classes of ceramics

## Properties:

$T_m$  for glass is moderate, but large for other ceramics.

low toughness and ductility; large moduli and creep resistance

# Glasses

Glasses are noncrystalline silicates containing other oxides such as  $\text{CaO}$ ,  $\text{Na}_2\text{O}$ ,  $\text{K}_2\text{O}$ , and  $\text{Al}_2\text{O}_3$ . Typical applications include containers, lenses, and fibreglass.

**Table 13.1** Compositions and Characteristics of Some of the Common Commercial Glasses

<i>Glass Type</i>	<i>Composition (wt%)</i>						<i>Characteristics and Applications</i>
	<i>SiO<sub>2</sub></i>	<i>Na<sub>2</sub>O</i>	<i>CaO</i>	<i>Al<sub>2</sub>O<sub>3</sub></i>	<i>B<sub>2</sub>O<sub>3</sub></i>	<i>Other</i>	
Fused silica	>99.5						High melting temperature, very low coefficient of expansion (thermally shock resistant)
96% Silica (Vycor™)	96				4		Thermally shock and chemically resistant—laboratory ware
Borosilicate (Pyrex™)	81	3.5		2.5	13		Thermally shock and chemically resistant—ovenware
Container (soda–lime)	74	16	5	1		4MgO	Low melting temperature, easily worked, also durable
Fiberglass	55		16	15	10	4MgO	Easily drawn into fibers—glass–resin composites
Optical flint	54	1				37PbO, 8K <sub>2</sub> O	High density and high index of refraction—optical lenses
Glass–ceramic (Pyroceram™)	43.5	14		30	5.5	6.5TiO <sub>2</sub> , 0.5As <sub>2</sub> O <sub>3</sub>	Easily fabricated; strong; resists thermal shock—ovenware

# Glass-ceramics

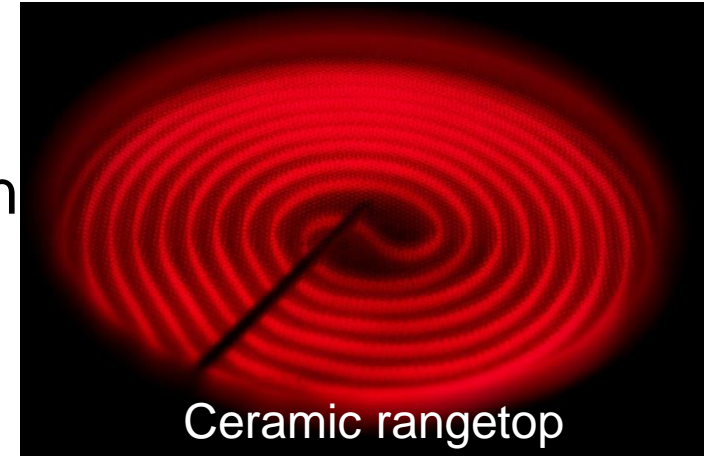

Noncrystalline to crystalline  
by the proper **high-  
temperature heat treatment**

# Glass-ceramics: properties and applications

## Properties:

- Relatively high mechanical strengths
- Low coefficients of thermal expansion
- High temperature capabilities
- Good dielectric properties
- Good biological compatibility.

By fras1977,  
released under CC  
BY-NC 2.0 license

## Applications:

Ovenware, tableware, oven windows, and rangetops

- Strength and excellent resistance to thermal shock

Electrical insulators, substrates for printed circuit boards, architectural cladding, heat exchangers and regenerators.

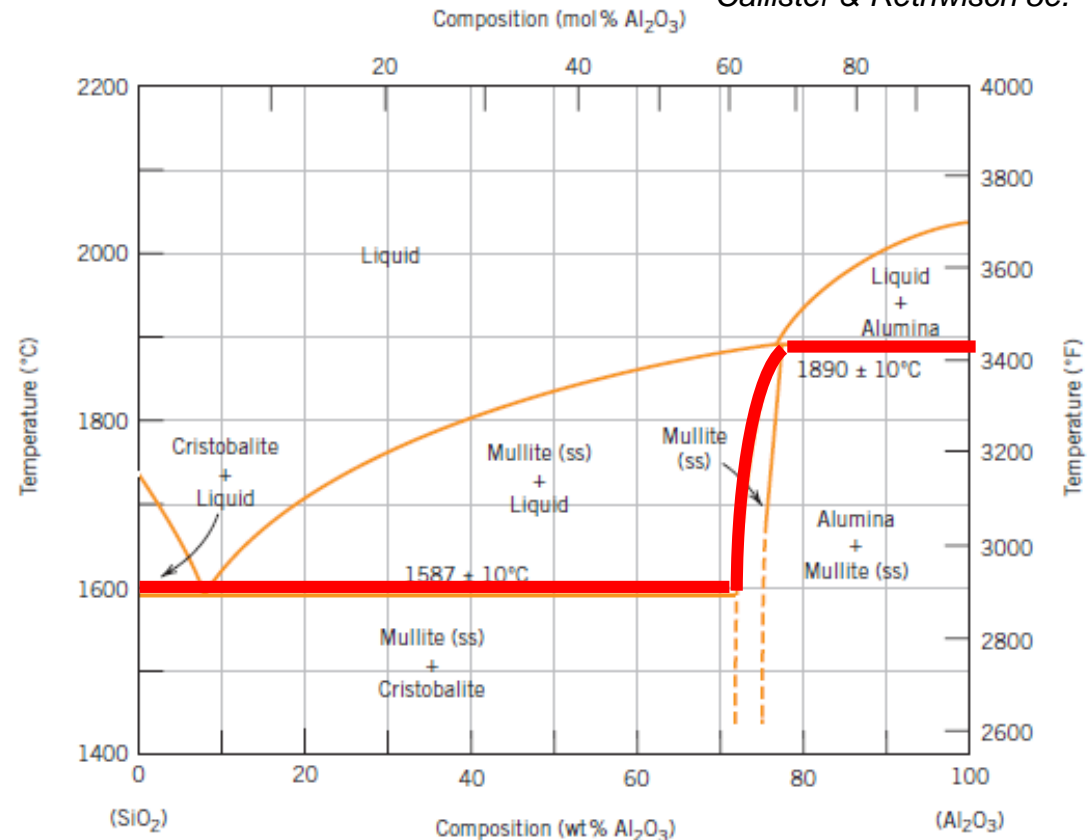

# Refractories: Properties

Have the capacity to  
**withstand high T's** without  
melting or decomposing.

Remain **unreactive** and  
inert when exposed to  
severe environments.

Also able to provide  
**thermal insulation**.

Adapted from Fig. 12.27,  
*Callister & Rethwisch 8e.*

Upgrading the alumina content will increase the maximum  
service temperature.

# Refractories: Applications

Typical applications include furnace linings for metal refining, glass manufacturing, metallurgical heat treatment, and power generation.

Metal pouring

Power line insulators

Data from Table 13.2, *Callister & Rethwisch 8e*.

**Table 13.2** Compositions of Five Common Ceramic Refractory Materials

Refractory Type	Composition (wt%)							Apparent Porosity (%)
	$Al_2O_3$	$SiO_2$	$MgO$	$Cr_2O_3$	$Fe_2O_3$	$CaO$	$TiO_2$	
Fireclay	25–45	70–50	0–1		0–1	0–1	1–2	10–25
High-alumina fireclay	90–50	10–45	0–1		0–1	0–1	1–4	18–25
Silica	0.2	96.3	0.6			2.2		25
Periclase	1.0	3.0	90.0	0.3	3.0	2.5		22
Periclase–chrome ore	9.0	5.0	73.0	8.2	2.0	2.2		21

# Abrasives: Properties

Abrasive ceramics are used to wear, grind, or cut away other materials, which necessarily are softer.

Properties:	Materials:
Hardness	Diamond (both natural and synthetic)

University of  
South Australia

# Abrasives: Applications

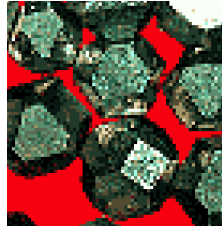

Tools for:

grinding

polishing

cutting

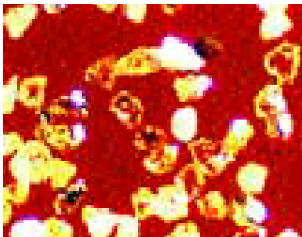

drilling

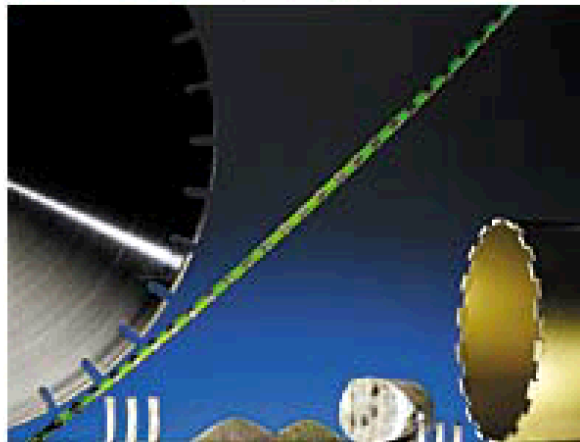

Coated single  
crystal diamonds

Oil drill bits

Polycrystalline  
diamonds in a resin  
matrix.

Cutting blades

# Cements

Characteristic feature of these materials is that when mixed with water they form a paste that subsequently sets and hardens.

By joanna8555 , released under  
CC BY-NC-ND 2.0 license

By Odaligh, released under  
CC BY-NC-ND 2.0 license

**Portland cement** is consumed in the largest tonnages.

The principal constituents are tricalcium silicate ( $3\text{CaO}-\text{SiO}_2$ ) and dicalcium silicate ( $2\text{CaO}-\text{SiO}_2$ ).

University of  
South Australia

# Cements

Produced by:

# Fabrication and processing of ceramics

A classification scheme for ceramic forming techniques.

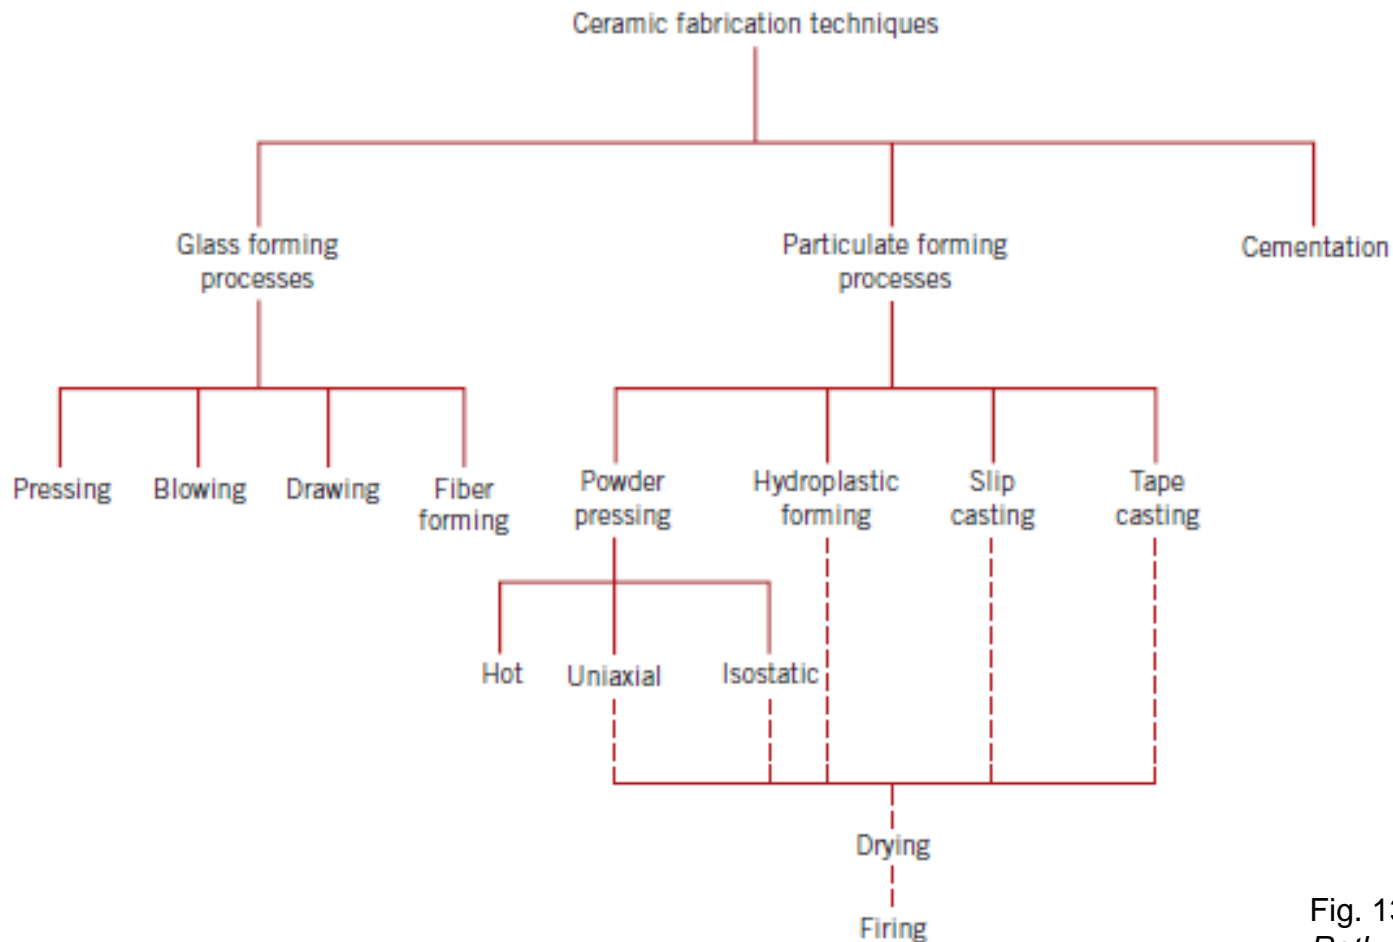

Fig. 13.05, Callister &  
Rethwisch 8e.

# Glass properties: viscosity–temperature characteristics

University of  
South Australia

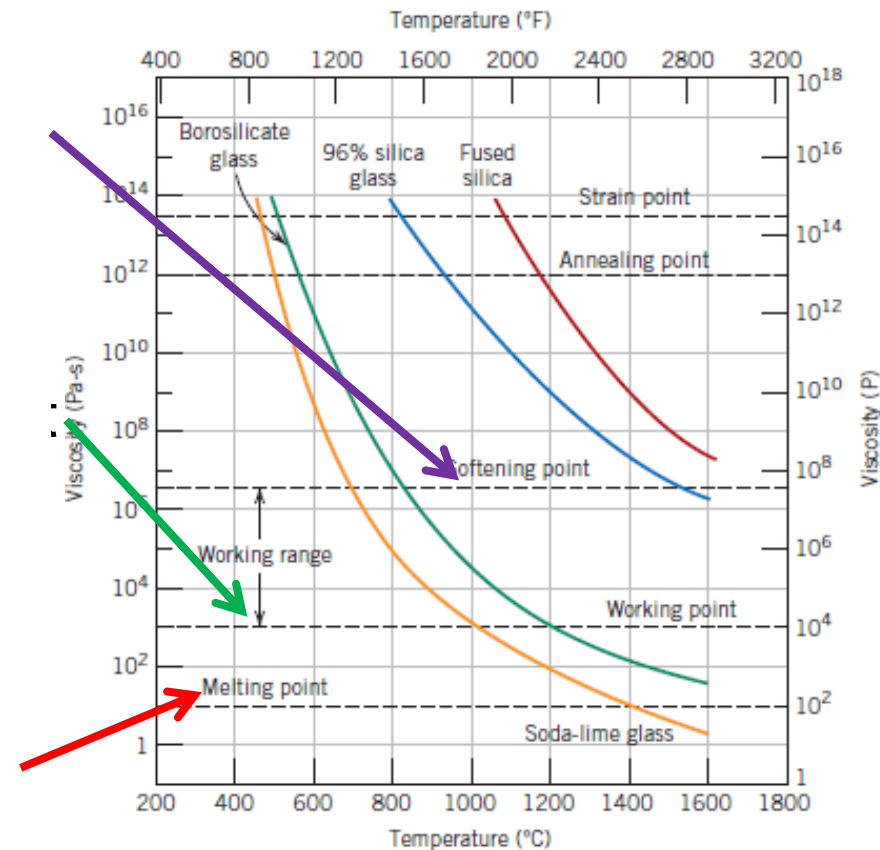

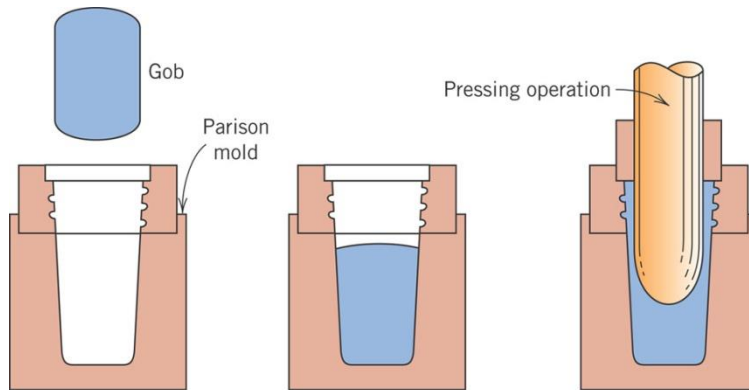

Fig. 13.07, Callister & Rethwisch 8e.

# Ceramic fabrication methods: glass forming

**Pressing:** plates, dishes, (relatively thick objects)

mold is steel with graphite lining

**Blowing:** jars, bottles, bulbs

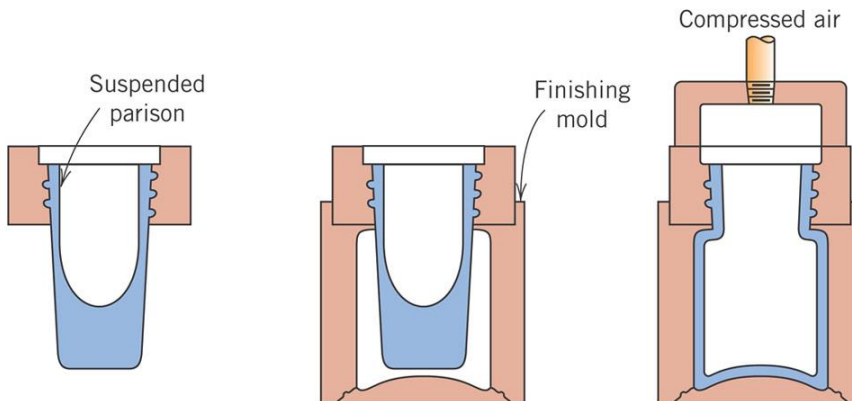

Fig. 13.8, *Callister & Rethwisch 8e*. (Fig. 13.8 is adapted from C.J. Phillips, *Glass: The Miracle Maker*, Pittman Publishing Ltd., London.)

# Ceramic fabrication methods: sheet glass forming

**Sheet forming:** Continuous draw - for making sheet, rod, tubing, fibers.

Sheets are formed by floating the molten glass on a pool of molten tin.

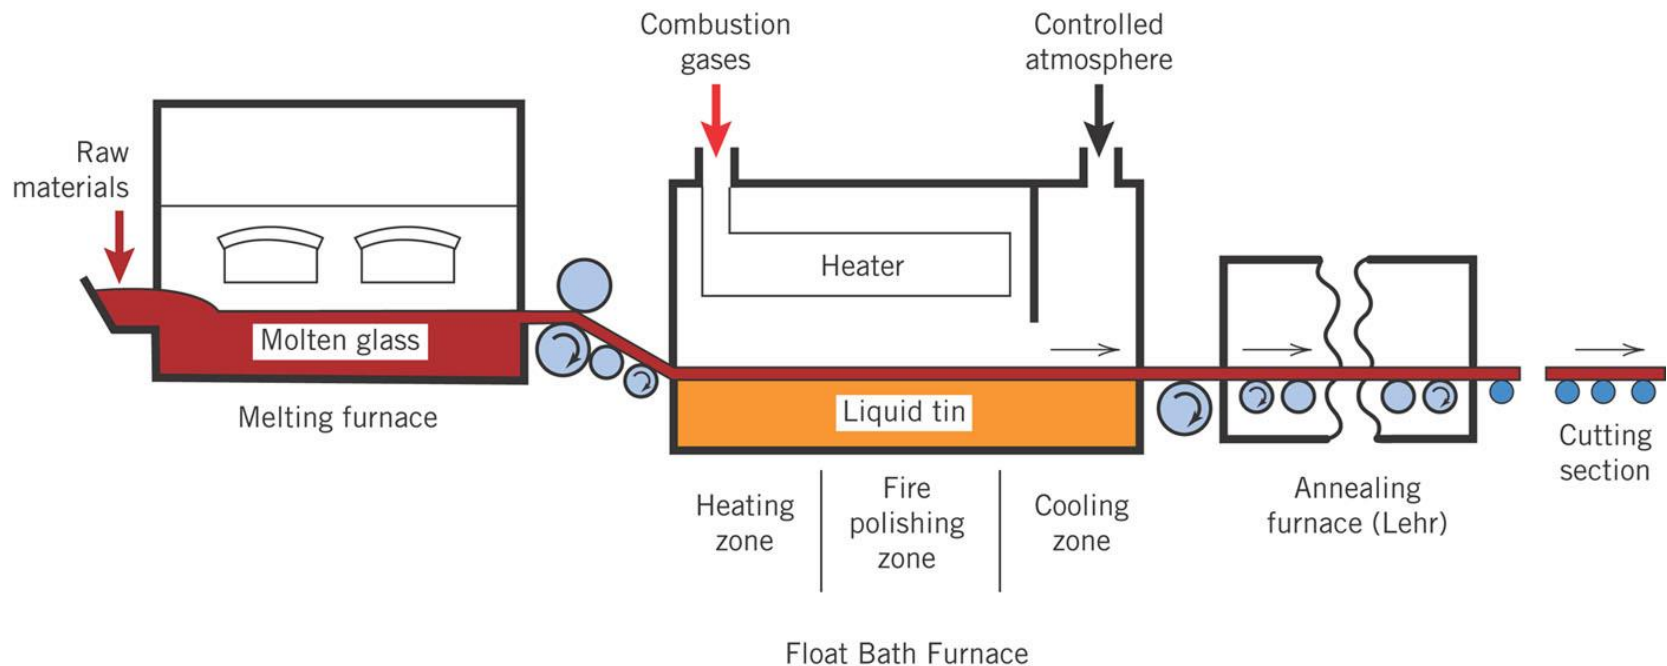

Fig. 13.9, *Callister & Rethwisch 8e*.

# Heat treating glass

**Annealing:** Removes internal stress caused by uneven cooling.

**Tempering:** Puts surface of glass part into compression, suppressing surface crack propagation

# Fabrication and processing of clay products: Clay composition

A mixture of components used i.e. typical porcelain:

# Characteristics of clays

**Hydroplasticity:** Becomes plastic when water is added.

# Ceramic fabrication methods

## Hydroplastic forming:

Mill (grind) and screen constituents: desired particle size.

Extrude this mass (e.g., into a brick).

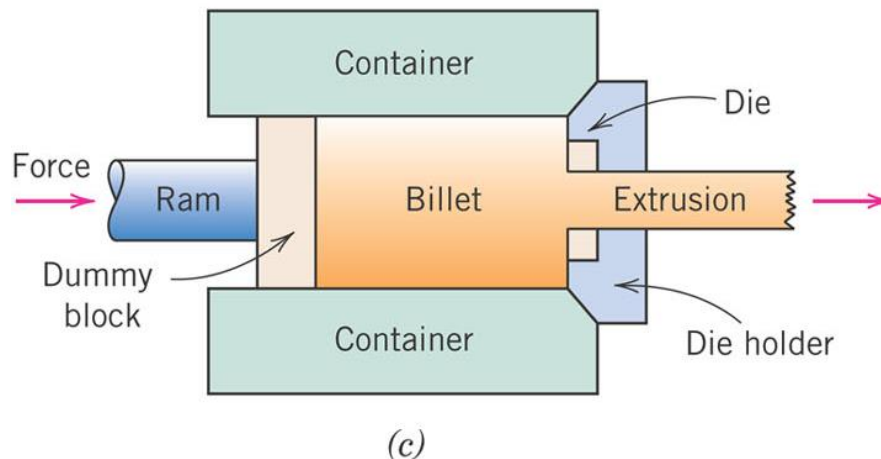

Fig. 11.8(c),  
*Callister &  
Rethwisch 8e.*

Dry and fire the formed piece.

# Ceramic fabrication methods

## Slip casting:

Mill (grind) and screen constituents: desired particle size.

Mix with water and other constituents to form slip.

Dry and fire the formed piece.

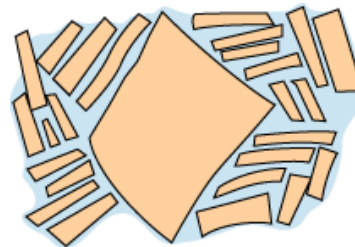

# Drying and firing

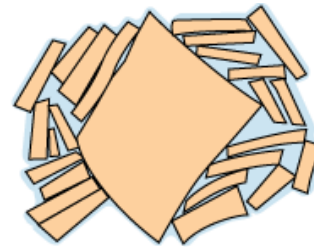

**Drying:** Layer size and spacing decrease.

Drying too fast causes sample to warp or crack due to non-uniform shrinkage.

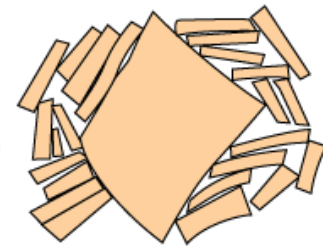

Adapted from Fig. 13.13, *Callister & Rethwisch 8e*. (Fig. 13.13 is from W.D. Kingery, *Introduction to Ceramics*, John Wiley and Sons, Inc., 1960.)

wet slip

partially dry

“green” ceramic

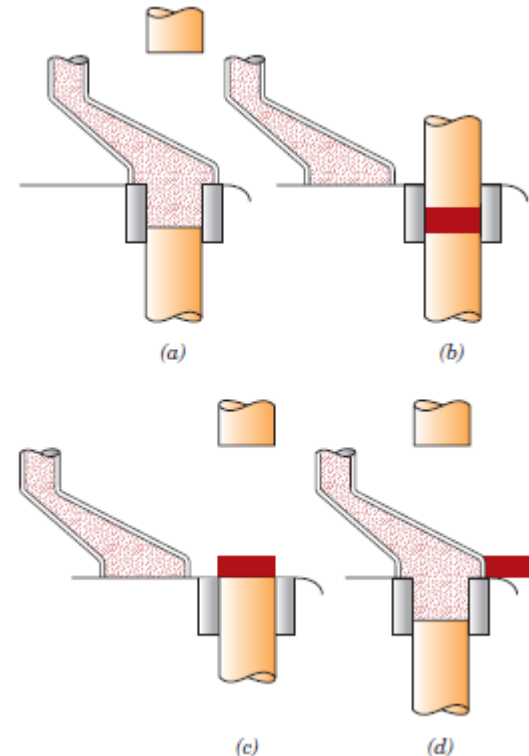

# Powder pressing

**Uniaxial compression:** Compacted in single direction.

**Isostatic (hydrostatic) compression:** Pressure applied by fluid - powder in rubber envelope.

**Hot pressing:** Pressure + heat.

Adapted from Fig. 13.15,  
*Callister & Rethwisch 8e.*

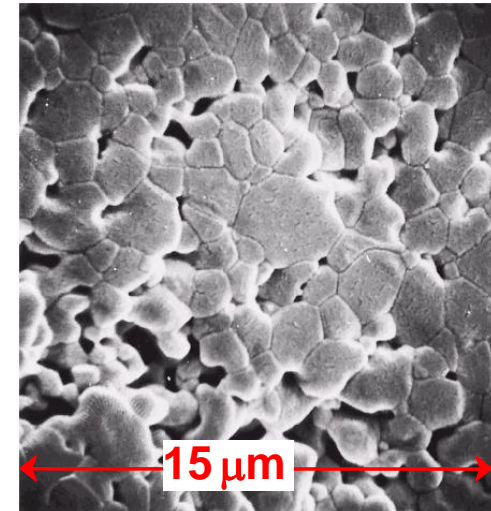

# Sintering

**Sintering:** Coalescence of the particles in a more dense mass.

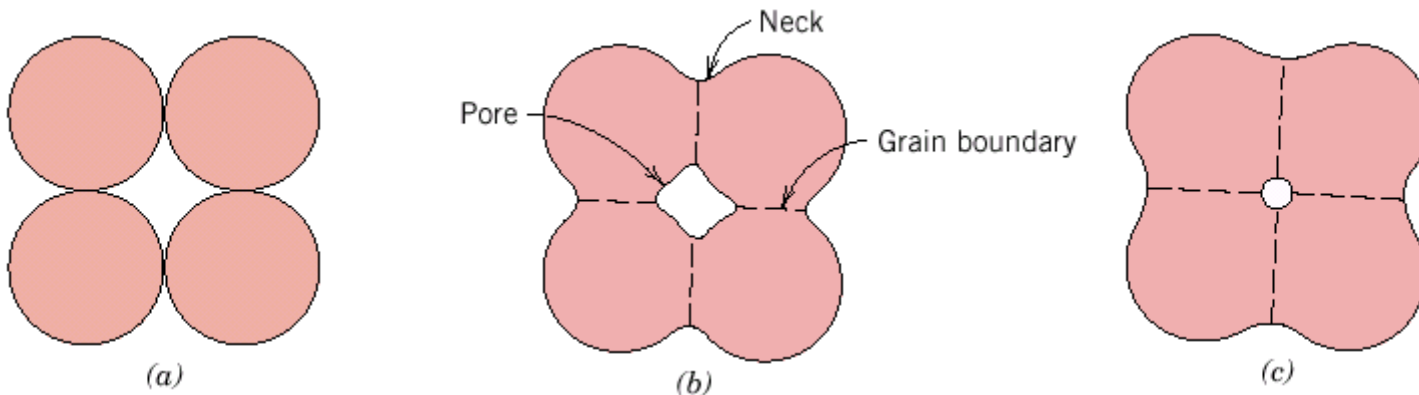

Powder touches, forms neck & gradually neck thickens.

→ Add processing aids to help form neck.

→ Little or no plastic deformation.

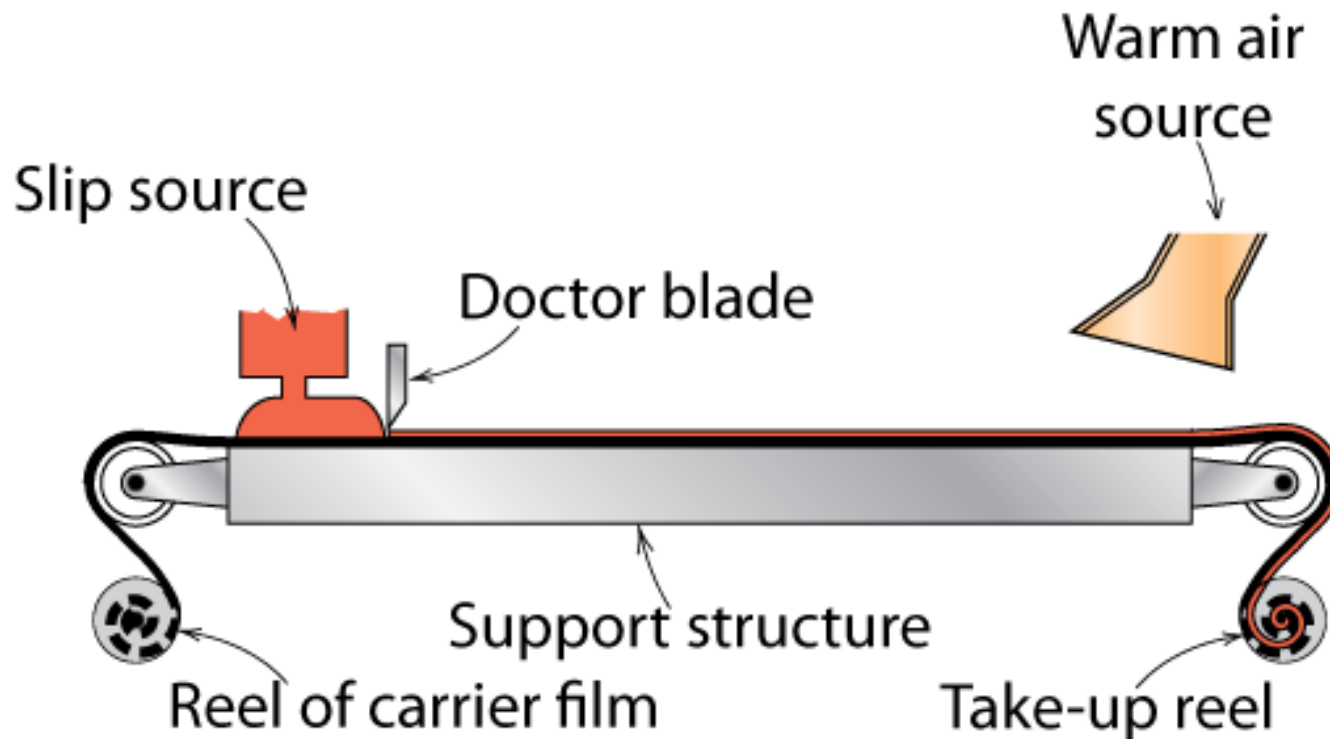

Adapted from Figs. 13.16 & 13.17,  
*Callister & Rethwisch 8e.*

# Tape casting

Thin sheets of green ceramic cast as flexible tape.  
Used for integrated circuits and capacitors.  
Cast from liquid slip (ceramic + organic solvent).

# Summary

- Ceramics are classified by both **structure and application**.
- Ceramics are processed as a **glass** (at high **temperatures**) and as **powders** under high **pressures**.

**Thank you**
